"Written by a national leader in early childhood music education, this creatively illustrated book contains everything you need to lead a music class for preschool and early elementary students, including: echo songs, call-and-response songs, simple songs, songtales, action songs, circle games, beat motion activities, and more. Repertoire in the curriculum is based on folk music and traditional songs and rhymes because of their natural melodic expressiveness, language flow, and texts filled with wonder. Additionally, the book includes complete lesson plans for a three-year curriculum, coordinates with high-quality recordings, and offers a classical music component perfect for movement."--From publisher's description.

Over the past 25 years, there has been an explosion of interest in the area of random tilings. The first book devoted to the topic, this timely text describes the mathematical theory of tilings. It starts from the most basic questions (which planar domains are tileable?), before discussing advanced topics about the local structure of very large random tessellations. The author explains each feature of random tilings of large domains, discussing several different points of view and leading on to open problems in the field. The book is based on upper-division courses taught to a variety of students but it also serves as a self-contained introduction to the subject. Test your understanding with the exercises provided and discover connections to a wide variety of research areas in mathematics, theoretical physics, and computer science, such as conformal invariance, determinantal point processes, Gibbs measures, high-dimensional random sampling, symmetric functions, and variational problems.

This book constitutes the refereed proceedings of three joint events - the International Workshop on Software Measurement, IWSM 2008, the DASMA Metrik Kongress, Metrikon 2008, and the International Conference on Software Process and Product Measurement, Mensura 2008, held in

Munich, Germany, in November 2008. The 30 revised full papers presented were carefully reviewed and selected from over 50 submissions for inclusion in the book. The papers are organized in topical sections on estimation models, measurement methodology, effort estimation, measurement programs, new approaches, prozessbewertung, size measurement, education, measurement in software lifecycle, and product measurement.

Though Rudolf Steiner is best known for his cultural influence in fields such as education, agriculture, and medicine, it is often forgotten that he made his contribution as a spiritual teacher. What he taught was, above all, a way of spiritual knowledge - a path of inner development to reconnect the spirit in us with the spirit in the universe. This book brings together for the first time a series of fundamental lectures on beginning a path of practice. Since it is by one of the great spiritual masters of the twentieth century, its wisdom and practicality are outstanding. Here readers will find descriptions of various practical exercises to develop the necessary moral qualities and states of consciousness that inner development requires. More advanced practices and techniques are also discussed. This is not just a book for beginners. Wherever you are on the path - whatever path you are on - this book can be a helpful companion.

Events on Wall Street and Main Street reveal that some business leaders make dramatically unethical self-serving decisions that ignore the public interest. How can business schools educate future business leaders to make ethical decisions? Unfortunately, most business schools fail in teaching ethical decision-making. They erroneously assume that such decision-making is primarily conscious and reason-based, reflecting the western cultural orientation toward science and logic. In this book, Thomas Culham cites neurological findings showing that unconscious processes and emotions play a much more significant role than reason in making ethical decisions. Culham urges business schools to teach a modified form of emotional intelligence, linked with research-supported contemplative practices from the great meditative traditions. This book details the author's ethics curriculum and explains its successful application at the Sauder School of Business at the University of British Columbia. This fascinating, interdisciplinary, and highly practical curriculum integrates

philosophy (virtue ethics), Daoist thinking, psychology, and neuroscience. This curriculum intends to transform the way business schools teach decision making. Such an effort might just transform the way we do business.

Unlock your brain's potential using mind mapping Mind mapping is a popular technique that can be applied in a variety of situations and settings. Students can make sense of complex topics and structure their revision with mind mapping; business people can manage projects and collaborate with colleagues using mind maps, and any creative process can be supported by using a mind map to explore ideas and build upon them. Mind maps allow for greater creativity when recording ideas and information whatever the topic, and enable the note-taker to associate words with visual representations. Mind Mapping For Dummies explains how mind mapping works, why it's so successful, and the many ways it can be used. It takes you through the wide range of approaches to mind mapping, looks at the available mind mapping software options, and investigates advanced mind mapping techniques for a range of purposes, including studying for exams, improving memory, project management, and maximizing creativity. Suitable for students of all ages and study levels An excellent resource for people working on creative projects who wish to use mind mapping to develop their ideas Shows businesspeople how to maximize their efficiency, manage projects, and brainstorm effectively If you're a student, artist, writer, or businessperson, Mind Mapping For Dummies shows you how to unlock your brain's potential.

"The Lectures comprised in the present Volumes form the second and concluding portion of the Biennial Course on Metaphysics and Logic, which was commenced by Sir William Hamilton on his election to the Professorial Chair in 1836, and repeated, with but slight alterations, till his decease in 1856. The Appendix contains various papers, composed for the most part during this period, which, though portions of their contents were publicly taught at least as early as 1840, were only to a very small extent incorporated into the text of the Lectures. The Lectures on Logic, like those on Metaphysics, were chiefly composed during the session in which they were first delivered (1837-8); and the statements made in the preface to the previous volumes, as regards the circumstances and manner of their composition, are equally applicable to the present course. In this, as in the preceding series, the Author has largely availed himself of the labours of previous writers, many of whom are but little known in this country. To the works of the German logicians of the present century, particularly to those of Krug and Esser, these Lectures are under especial obligations"-- Preface. Whether preparing to take the SATs or trying to finish your graduate degree in the evenings, 50 plus one Ways to Improve Your Study Habits is a must. Everyone who is trying to improve their academic standing needs help and this easy-to-use book with handy, practical tips is just the ticket. Learn the importance of regular study time, create a study environment that is free of distractions and learn the importance of personal organization. Learn to learn by using the limited amount of time you

have more effectively. You will learn: the essentials of good study habits; time management; how to set priorities; schedule study time when you are at your peak; how to create the proper study environment; how to design a self-motivated reward system; how to remove pressure when studying, and much more. A perfect gift for every student, regardless of age or educational level.

This book provides a quick access to computational tools for algebraic geometry, the mathematical discipline which handles solution sets of polynomial equations. Originating from a number of intense one week schools taught by the authors, the text is designed so as to provide a step by step introduction which enables the reader to get started with his own computational experiments right away. The authors present the basic concepts and ideas in a compact way.

Kaplan Medical's USMLE Step 1 Lecture Notes 2021: 7-Book Set offers in-depth review with a focus on high-yield topics in every discipline—a comprehensive approach that will help you deepen your understanding while focusing your efforts where they'll count the most. Used by thousands of medical students each year to succeed on USMLE Step 1, Kaplan's official lecture notes are packed with full-color diagrams and clear review. The 7 volumes—Pathology, Pharmacology, Physiology, Biochemistry/Medical Genetics, Immunology/Microbiology, Anatomy, and Behavioral Science/Social Sciences—are updated annually by Kaplan's all-star expert faculty. The Best Review 2,000 pages covering every discipline you'll need on this section of the boards Full-color diagrams and charts for better comprehension and retention Clinical correlations and bridges between disciplines highlighted throughout Chapter summary study guides at the end of every chapter for easier review Up-To-Date Content Clinical updates included in all 7 volumes to align with recent changes Organized in outline format with high-yield summary boxes for efficient study

Lent Lectures. 1 Joshua. 2 Solomon American Mathematical Soc.

According to the initiate-research of Rudolf Steiner, humanity is in a continual process of transformation and evolution. Modern-day consciousness, based as it is on sense perception and abstract logic, differs considerably from the consciousness of ancient humanity. At that time, says Steiner, the human being was seen to be a microcosm, a concentration of the laws and activities of the cosmos. The loss of such knowledge today has led to the existential quest for meaning, and even the cul-de-sac of atheism. In these comprehensive lectures, delivered to an English audience, Rudolf Steiner indicates how it is possible for people to rediscover their connection to the cosmos. He describes how one develops higher faculties of consciousness - what he calls Imagination, Inspiration and Intuition - and gives a vivid description of life after death and the individual's progress through the planetary spheres. It is in these spheres, he explains, where tasks and goals for future incarnations are prepared in cooperation with the spiritual beings of the heavenly hierarchies. The lectures culminate in a call for mankind to take its own destiny in hand through

conscious and free development of spiritual capacities. The edition of this fundamental work features a revised translation as well as previously-unavailable addresses and question-and-answer sessions.

Great Moments in Mathematics: Before 1650 is the product of a series of lectures on the history of mathematics given by Howard Eves. He presents here, in chronological order, 20 "great moments in mathematics before 1650", which can be appreciated by anyone who enjoys mathematics. These wonderful lectures could be used as the basis of a course on the history of mathematics but can also serve as enrichment to any mathematics course. Included are lectures on the Pythagorean Theorem, Euclid's Elements, Archimedes (on the sphere), Diophantus, Omar Khayyam, and Fibonacci.

A Quick Start using SINGULAR

The general topic of this volume concerns the origin, evolution, distribution, and destiny of life in the Universe. Firstly, it discusses the transition from inert matter to cellular life and its evolution to fully developed intelligent beings, and also the possibility of life occurring elsewhere, particularly in other environments in our own and other solar systems. Secondly, the book explores the role that space missions may play in obtaining further insight into the question of the origin of life. Reviews are included of the research for microorganisms in the solar system and the well-established project for the search for extraterrestrial intelligence. The present work is much broader in its scope than in previous conferences: over one hundred leading scientists have reviewed the entire range of subjects dealt with in these sixty-nine papers. Audience: This book is aimed at advanced students, as well as researchers, in the many areas of basic, earth, and life sciences that contribute to the study of the first steps in the origin of life.

Superconductivity: From Basic Physics to the Latest Developments

The theme of the 2010 PCMI Summer School was Mathematics in Image Processing in a broad sense, including mathematical theory, analysis, computation algorithms and applications. In image processing, information needs to be processed, extracted and analyzed from visual content, such as photographs or videos. These demands include standard tasks such as compression and denoising, as well as high-level understanding and analysis, such as recognition and classification. Centered on the theme of mathematics in image processing, the summer school covered quite a wide spectrum of topics in this field. The summer school is particularly timely and exciting due to the very recent advances and developments in the mathematical theory and computational methods for sparse representation. This volume collects three self-contained lecture series. The topics are multi-resolution based wavelet frames and applications to image processing, sparse and redundant representation modeling of images and simulation of elasticity, biomechanics, and virtual surgery. Recent advances in image processing, compressed sensing and sparse representation are discussed.
