The World Book Encyclopedia Yale University Press

This little book is confined to very simple "reading lessons upon the Form and Motions of the Earth, the Points of the Compass, the Meaning of a Map: Definitions." The shape and motions of the earth are fundamental ideas—however difficult to grasp. Geography should be learned chiefly from maps, and the child should begin the study by learning "the meaning of map," and how to use it. These subjects are well fitted to form an attractive introduction to the study of Geography: some of them should awaken the delightful interest which attaches in a child's mind to that which is wonderful—incomprehensible. The Map lessons should lead to mechanical efforts, equally delightful. It is only when presented to the child for the first time in the form of stale knowledge and foregone conclusions that the facts taught in these lessons appear dry and repulsive to him. An effort is made in the following pages to treat the subject with the sort of sympathetic interest and freshness which attracts children to a new study. A short summary of the chief points in each reading lesson is given in the form of questions and answers. Easy verses, illustrative of the various subjects, are introduced, in order that the children may connect pleasant poetic fancies with the phenomena upon which "Geography" so much depends. It is hoped that these reading lessons may afford intelligent teaching, even in the hands of a young teacher. The first ideas of Geography—the lessons on "Place"—which should make the child observant of local geography, of the features of his own neighbourhood, its heights and hollows and level lands, its streams and ponds—should be conveyed viva voce. At this stage, a class-book cannot take the place of an intelligent teacher. Children should go through the book twice, and should, after the second reading, be able to answer any of the questions from memory. Charlotte M. Mason

Exploring Our World McGraw-Hill Education

A new edition of the bestselling classic – published with a special introduction to mark its 10th anniversary This pioneering account sets out to understand the structure of the human brain – the place where mind meets matter. Until recently, the left hemisphere of our brain has been seen as the 'rational' side, the superior partner to the right. But is this distinction true? Drawing on a vast body of experimental research, Iain McGilchrist argues while our left brain makes for a wonderful servant, it is a very poor master. As he shows, it is the right side which is the more reliable and insightful. Without it, our world would be mechanistic – stripped of depth, colour and value.

World History McGraw-Hill Education

For centuries, the Asians (Chinese, Indians, Muslims, and others) have been bystanders in world history. Now they are ready to become co-drivers. Asians have finally understood, absorbed, and implemented Western best practices in many areas: from free-market economics to modern science and technology, from meritocracy to rule of law. They have also become innovative in their own way, creating new patterns of cooperation not seen in the West. Will the West resist the rise of Asia? The good news is that Asia wants to replicate, not dominate, the West. For a happy outcome to emerge, the West must gracefully give up its domination of global institutions, from the IMF to the World Bank, from the G7 to the UN Security Council. History teaches that tensions and conflicts are more likely when new powers emerge. This, too, may happen. But they can be avoided if the world accepts the key principles for a new global partnership spelled out in *The New Asian Hemisphere*.
