This book provides a recent and relevant coverage based on a systematic approach. Especially suitable for practitioners and managers, the book has also been classroom tested in IS/IT courses on security. It presents a systematic approach to build total systems solutions that combine policies, procedures, risk analysis, threat assessment through attack trees, honeypots, audits, and commercially available security packages to secure the modern IT assets (applications, databases, hosts, middleware services and platforms) as well as the paths (the wireless plus wired network) to these assets. After covering the security management and technology principles, the book shows how these principles can be used to protect the digital enterprise assets. The emphasis is on modern issues such as e-commerce, e-business and mobile application security; wireless security that includes security of Wi-Fi LANs, cellular networks, satellites, wireless home networks, wireless middleware, and mobile application servers; semantic Web security with a discussion of XML security; Web Services security, SAML (Security Assertion Markup Language)and .NET security; integration of control and audit concepts in establishing a secure environment. Numerous real-life examples and a single case study that is developed throughout the book highlight a case-oriented approach. Complete instructor materials (PowerPoint slides, course outline, project assignments) to support an academic or industrial course are provided. This book sets out to critically explore and examine the potential consequences of e-business for auditing practice and education aiming to: investigate the impact of e-business on the technical aspects of financial auditing; explore the potential consequences of e-business for the auditing profession; and examine the consequent response to e-business changes.The investigation into the above objectives is approached through the employment of a number of different research methods: semi-structured interviews; postal questionnaires; and content analysis. The findings from this study make three main contributions to the fields of auditing practice, auditing professionalisation and accounting education. First, the research demonstrates the potential electronic transformation of financial audit practice. Secondly, the study predicts the possible jurisdictional dispute between financial auditors and IT auditors over e-business audit services. Finally, the study shows that universities are somewhat 'under-achieving' with respect to the e-business education provided to accounting undergraduates.

It is in the context of the huge (but largely unaccountable) impact of accounting and accountants that the demise of Arthur Andersen and the financial scandals of the past few years need to be seen. These scandals raise questions of independence and the role of the audit industry in alerting investors, employees, suppliers, customers and the general public to the realities of corporate wrongdoing and weakness. This paper introduces a Special Issue that offers a counter-hegemonic story, pointing out that things can be different and better in substantive ways, that auditor independence and integrity require more substantive thinking and analysis than simple re-arrangements of regulatory institutions or calls for superheroes who can transcend pressures to abet crime. After reviewing the contents of the various contributions to this Special Issue, the paper makes some brief comments about possible solutions to the problem of independence of audits and suggests a focus on audit, not auditor, independence.

Since the early 1980s there has been an explosion of auditing activity in the United Kingdom and North America. In addition to financial audits there are now medical audits, technology audits, value for money audits, environmental audits, quality audits, teaching audits, and many others. Why has this happened? What does it mean when a society invests so heavily in an industry of checking and when more and more individuals find themselves subject to formal scrutiny? The Audit Society argues that the rise of auditing has its roots in political demands for accountability and control. At the heart of a new administrative style internal control systems have begun to play an important public role and individual and organizational performance has been increasingly formalized and made auditable. Michael Power argues that the new demands and expectations of audits live uneasily with their operational capabilities. Not only is the manner in which they produce assurance and accountability open to question but also, by imposing their own values, audits often have unintended and dysfunctional consequences for the audited organization.
