NOBLE CODY

Minescape Daylight Books

Providing a holistic understanding of extensive oil extraction in rural Mexico, this book focuses on a campesino community, where oil extraction is deeply inscribed into the daily lives of the community members. The book shows how oil shapes the space where it is extracted in every aspect and produces multiple uncertainties. The community members express these uncertainties using the metaphor of the time bomb. The book shows how they find ways to "live off the time bomb" by using mechanisms of short-term coping and long-term adaptation and thus, developing the capability to determine their lives despite the ever-changing challenges.

The title of any monograph must necessarily be a compromise between brevity and precision, and the needs of this compromise are particularly pressing in a newly emerging area of scientific interest, one that is not only inter- or bidisciplinary, but tridisciplinary, involving as it does psychology, pharmacology, and genetics. The temptation to call this work "psychopharmacogenetics" -tout court, if the phrase can be applied to so polysyllabic a construction-was removed by the timely appearance of the book under that title edited by Eleftheriou (1975b). Accordingly, something less novel has been chosen. It might be thought to promise more than it delivers and to

delineate a wider field than it covers, but I have sought to add a corrective degree of precision in the subtitle which accurately defines what is intended even at the cost of further polysyllabification. The survey of a disparate field of this kind entrains difficulties that go beyond what to call it. The claims of the parent disciplines for methodological supremacy are strong and difficult to resist. What I have done is to seek to impose a degree of coherence on the chosen area by always inquiring to what extent a particular methodology, derived from one part of one of them only, can be applied to the whole.

Bringing together archaeological, paleoenvironmental, paleontological and genetic data, this book makes a first attempt to reconstruct African population histories from out species' evolution to the Holocene. Africa during Marine Isotope Stages (MIS) 6 to 2 (~190-12,000 years ago) witnessed the biological development and behavioral florescence of our species. Modern human population dynamics, which involved multiple population expansions, dispersals, contractions and extinctions, played a central role in our species' evolutionary trajectory. So far, the demographic processes – modern human population sizes, distributions and movements – that occurred within Africa during this critical period have been consistently under-addressed. The

authors of this volume aim at (1) examining the impact of this glacial-interglacial- glacial cycle on human group sizes, movements and distributions throughout Africa; (2) investigating the macro- and micro-evolutionary processes underpinning our species' anatomical and behavioral evolution; and (3) setting an agenda whereby Africa can benefit from, and eventually contribute to, the increasingly sophisticated theoretical and methodological palaeodemographic frameworks developed on other continents.
