Machine learning techniques provide cost-effective alternatives to traditional methods for extracting underlying relationships between information and data and for predicting future events by processing existing information to train models. Efficient Learning Machines explores the major topics of machine learning, including knowledge discovery,

classifications, genetic algorithms, neural networking, kernel methods, and biologically-inspired techniques. Mariette Awad and Rahul Khanna's synthetic approach weaves together the theoretical exposition, design principles, and practical applications of efficient machine learning. Their experiential emphasis, expressed in their close analysis of sample algorithms throughout the book, aims to equip engineers, students of engineering, and system designers to design and create new and more efficient machine learning systems. Readers of Efficient Learning Machines will learn how to recognize and analyze the problems that machine learning technology can solve for them, how to implement and deploy standard solutions to sample problems, and how to design new systems and solutions. Advances in computing performance, storage, memory, unstructured information retrieval, and cloud computing have coevolved with a new generation of machine learning paradigms and big data analytics, which

the authors present in the conceptual context of their traditional precursors. Awad and Khanna explore current developments in the deep learning techniques of deep neural networks, hierarchical temporal memory, and cortical algorithms. Nature suggests sophisticated learning techniques that deploy simple rules to generate highly intelligent and organized behaviors with adaptive, evolutionary, and distributed properties. The authors examine the most popular biologically-inspired algorithms, together with a sample application to distributed datacenter management. They also discuss machine learning techniques for addressing problems of multi-objective optimization in which solutions in real-world systems are constrained and evaluated based on how well they perform with respect to multiple objectives in aggregate. Two chapters on support vector machines and their extensions focus on recent improvements to the classification and regression techniques at the core of machine learning.

Revised to reflect the needs of today's users, this 10th edition of Database Processing assures that you will learn marketable skills. By presenting SQL SELECT statements near the beginning of the book readers will know early on how to query data and obtain results seeing firsthand some of the ways that database technology is useful in the marketplace. By utilizing free software downloads, you will be able to actively use a DBMS product by the end of the 2nd chapter. Each topic appears in the context of accomplishing practical tasks. Its spiral approach to database design (incorporating all 3 sources: from the integration of existing data, from new information, and the need to redesign an existing database) provides users with enhanced information not available in

other database books on the market. Topics include: SQL, database design, implementation, processing, access standards, and business intelligence. An excellent reference and handbook for information systems professionals such as database administrators, database designers, systems analysts, web-database developers, and programmers of database applications.

The design and functioning of an information system improve to the extent that the system can handle the questions people ask. Surprisingly, however, researchers in the cognitive, computer, and information sciences have not thoroughly examined the multitude of relationships between information systems and questions -- both question asking and answering. The purpose of this book is to explicitly examine these relationships. Chapter contributors believe that questions play a central role in the analysis, design, and use of different kinds of natural or artificial information systems such as human cognition, social interaction, communication networks, and intelligent tutoring systems. Their efforts show that data structures and representations need to be organized around the

questioning mechanisms in order to achieve a quick retrieval of relevant useful information.

Originally published in 1991, this book looks at the problems of applying Western computer programmes to the developing world, arguing that the difficulties are as much cultural as technological. The author shows that the underlying models for computer applications are made up from interpretations of reality which are closely related to Western scientific, technological and cultural development originating from the Renaissance. The book includes a case study of an Egyptian manufacturing company, which reveals the actual problems encountered in the process of computerization.
