How to Unleash the Power of Cost Information Springer Nature

Four questions determine whether a company is using interorganizational cost management. Does your firm set specific cost-reduction objectives for its suppliers? Does your firm help its customers and/or suppliers find ways to achieve their cost-education objectives? Does your firm take into account the profitability of its suppliers when negotiating component pricing with them? Is your firm continuously making its buyer-supplier interfaces more efficient? If the answer to any of these questions is ""no"", your firm risks introducing products that cost too much or are not competitive. The full potential of the supply network can be realized only when the entire supply chain adopts interorganizational cost management practices. Competitive pressure has led many firms to try to increase the efficiency of supplier firms through interorganizational cost management systems, a structured approach to coordinating the activities of firms in a supplier network to reduce the total costs in the network. It is particularly important to lean enterprises for two reasons: Lean enterprises typically outsource more of the added value of their products than their mass producer counterparts. Lean enterprises usually compete more aggressively and must manage costs more effectively. Interorganizational cost management can reduce costs in three ways: through product design, through product manufacture and through cooperative approaches between buyers and suppliers to build smoother interfaces. However, more than just cost management must cross interorganizational boundaries. Suppliers are also a major source of innovation for lean enterprises. Successful supplier networks encourage every firm in the network to innovate and compete more aggressively. Read this book to learn to manage the supply chain to forge competitive advantage

while reducing costs.

What would happen if everyone in your company followed a disciplined approach to cost reduction? Go ahead -- imagine it. What would it look like? How can it be done? The answer -- smart cost management. Effective cost management must start at the design stage. As much as 90-95% of a product's costs are added in the design process. That is why effective cost management programs focus on design and manufacturing. The primary cost management method to control cost during design is a combination of target costing and value engineering. Target Costing Objectives: Identify the cost at which your product must be manufactured at if it is to earn its profit margin at its expected target selling price. Break the target cost down to its component level and have your suppliers find ways to deliver the components they sell you at the set target prices while still making adequate returns. Value Engineering: The connection to function: An organized effort and team based approach to analyze the functions of goods and services that the design stage, and find ways to achieve those functions in a manner that allows the firm to meet its target costs. The result: Added value for your company (development costs on-line with added value for your company; development costs on-line with selling prices) and added value for your customer (higher quality products that meet, possibly even exceed, customer expectations.)
