and double Lorentz, and Drude oscillators. • Lorentz dispersion model The Lorentz classical theory (1878) is based on the classical theory of interaction between light and matter and is used to describe frequency dependent polarization due to bound charge. The Lorentzian dispersion formula comes from the solution of the Classical Dispersion Model - horiba.com The model uses mathematical relations called dispersion formulas that help to evaluate the material's optical properties by adjusting specific fit parameters. This technical note deals with the Drude dispersion formula. Note that the technical notes «Classical dispersion model» and «Lorentz dispersion model» are complementary to this one. Drude Dispersion Model - Horiba New Amorphous theoretical model The «New

Amorphous» dispersion formula was derived by Horiba Jobin Yvon on the basis of Forouhi-Bloomer formulation. This new formulation was established in order to give a Lorentzian shape to the expressions of the extinction coefficient and refractive index. The absorption coefficient is given by : New Amorphous Dispersion Formula - Horiba The Lorentz oscillator is a prototype to model many absorbing materials.
