Information and Communications Technology (ICT) has the potential to improve services provided by the public and voluntary sectors, empower staff and

strengthen the community. Therefore, it is in the interests of those working in social welfare to understand and grapple with key issues. This book analyses the current context and use of ICT in these sectors and builds on this to provide practical guidance for managers and staff. Assuming no technical knowledge, the book provides the ideas, tools and resources to think critically and creatively about current ICT practice and to implement positive change at individual, team and organisational level.

This book effectively challenges the conventional wisdom regarding the cluster-

innovation relationship and provides convincing evidence to show that the prevailing theoretical models derived from Anglo-American experiences cannot be uncritically applied to Chinese reality. This book introduces a new theory of state-firm coordination to explain why and how some Chinese ICT firms have turned out to be more innovative than others. Perspectives from the viewpoint of economic geography, institutional economics, political science, and regulation theory have been provided to throw light on the enigma that is China's ICT industry. Empirically, the book provides state-of-the-art findings to clarify the confusion and misunderstanding

about the exact nature of the ICT industry in China. This book has essentially set a new baseline and made definitive contribution to knowledge production about China's economic geography. Methodologically, it shows how original, critical, and independent research can be undertaken effectively and innovatively through cross-disciplinary theoretical interaction, deductive reasoning with hypotheses testing, combination of multiple means of data collection; integration of quantitative and qualitative methods; and structured presentation of research findings with extensive tabular, graphic, and cartographic

illustrations.

This is a collection of the accepted papers concerning soft computing in information communication technology. All accepted papers are subjected to strict peer-reviewing by 2 expert referees. The resultant dissemination of the latest research results, and the exchanges of views concerning the future research directions to be taken in this field makes the work of immense value to all those having an interest in the topics covered. The present book represents a cooperative effort to seek out the best strategies for effecting improvements in the quality and the

reliability of Neural Networks, Swarm Intelligence, Evolutionary Computing, Image Processing Internet Security, Data Security, Data Mining, Network Security and Protection of data and Cyber laws. Our sincere appreciation and thanks go to these authors for their contributions to this conference. I hope you can gain lots of useful information from the book.

This book constitutes the thoroughly refereed proceedings of the Third International Multi-topic Conference on Communications, Technologies, Information Security and Sustainable Development, IMTIC

2013, held in Jamshoro, Pakistan, in December 2013. The 27 revised papers presented in this volume were carefully reviewed and selected from 140 submissions. The topics presented had a reasonable balance between theory and practice in multi-disciplined topics including wireless sensor networks, cloud computing, wireless communication, antenna design, signal processing, software engineering, image processing, bioinformatics and telemedicine, neural networks, automation and control, and green renewable energy.

Problem-based

learning (PBL) has excited interest among educators around the world for several decades. Among the most notable applications of PBL is the approach taken at the Faculty of Health, Medicine and Life sciences (FHML) at Maastricht University, the Netherlands. Starting in 1974 as a medical school, the faculty embarked on the innovative pathway of problem-based learning, trying to establish a medical training program which applied recent insights of education which would be better adapted to the needs of the modern physician. The medical school, currently part of the FHML, can be considered as an 'established' school, where original

innovations and educational changes have become part of a routine. The first book to bring this wealth of information together, *Lessons from Problem-based Learning* documents those findings and shares the experiences of those involved, to encourage further debate and refinement of problem-based learning in specific applications elsewhere and in general educational discussion and thought. Each chapter provides a description of why and what has been done in the Maastricht program, followed by reflection on the benefits and issues that have arisen for these developments. The final section of the book examines the application of PBL in

the future, and how it is likely to develop further.

This book identifies areas that represent new needs and opportunities for human factors research in the coming decades. It is forward-looking, problem oriented, and selectively focused on national or global problems, including productivity in organizations, education and training, employment and disabilities, health care, and environmental change; technology issues, including communications technology and telenetworking, information access and usability, emerging technologies,

automation, and flexible manufacturing, and advanced transportation systems; and human performance, including cognitive performance under stress and aiding intellectual work.

demonstrates how to apply concepts to research problems, issues, projects, and questions that communication practitioners face every day. Recognizing that students engage more directly with research methods when they experience research through hands-on practice, authors Michael Boyle

and Mike Schmierbach developed this text to demonstrate the relevance of research in professional roles and communication careers. Along with its distinctive approach to research methods instruction, this text also serves as an enhanced glossary and a superior reference. Students can easily navigate key concepts and terminology, which are linked to practical exercises within the context of the instruction. In-unit activities and features provide numerous opportunities to delve further into topics covered in class, including: Research in Depth – examples of a concept being used in scholarly research Reflect and React – thought-provoking problems and issues

that promote reflection and discussion Voices from Industry – Q&As with professionals working in communication industries End-of-unit activities – exercises that reinforce concepts and content Online resources, including sample syllabi, test banks, and more, are available on the companion website: www.routledge.com/cw/boyle. It includes the latest advances and research findings in fields of computational science and communication such as communication & networking, web & informatics, hardware and software designs, distributed & parallel processing, advanced software engineering, advanced database management systems and bioinformatics. As such, it is of interest to research scholars, students, and engineers around the globe.

It is now widely

recognized that the effective management of knowledge assets is a key requirement for securing competitive advantage in the emerging information economy. Yet the physical and institutional differences between tangible assets and knowledge assets remain poorly understood. In the case of knowledge, the ownership and control of assets are becoming ever more separate, a phenomenon that is actually exacerbated by the phenomenon of learning. If we are to meet the challenges of the information economy, then we need a new approach to property rights based on a deeper theoretical understanding of knowledge assets. Max Boisot writes clearly

and in accessible language providing some of the key building blocks which are needed for a theory of knowledge assets. He develops a powerful conceptual framework, the Information-Space or I-Space, for exploring the way knowledge flows within and between organizations. This framework will enable managers and students to explore and understand how knowledge and information assets differ from physical assets, and how to deal with them at a strategic level within their organizations.

According to the World Health Organisation (WHO), e-health is the combined use of electronic communication and information technology in the health sector and, moreover, it enables a safer, higher quality, more equitable, and sustainable health system. Emerging Communication Technologies for E-Health and Medicine is a fundamental source for the advancement of knowledge, application, and practice in the interdisciplinary areas of healthcare, e-health, m-health, u-health, sensors, biomedical engineering, and telemedicine. Due to its grounding in

research and theory evidence, this book is designed for use in graduate courses in health management, medicine, nursing, health professionals, and medical informatics. The book can help to e-health contents, applications, and interesting experiences. It is an important way to communicate e-health concepts.

Originally published in 1997, this book puts information management in the context of technology transfer,

industrialization and national development. As well as showing the necessity for the efficient use of information resources, the book also examines the costs of poor information management in undermining negotiation, the preparation of contingencies and the ability to let go of 'dead projects'. The book includes case studies of two technology transfer projects in Kenya are included.

Building an Effective Security Program for Distributed Energy Resources and Systems Build a critical and effective security program for DERs
Building an Effective Security Program for

Distributed Energy Resources and Systems requires a unified approach to establishing a critical security program for DER systems and Smart Grid applications. The methodology provided integrates systems security engineering principles, techniques, standards, and best practices. This publication introduces engineers on the design, implementation, and maintenance of a security program for distributed energy resources (DERs), smart grid, and industrial control systems. It provides security professionals with understanding the specific requirements of industrial control systems and real-time constrained

applications for power systems. This book:
 Describes the cybersecurity needs for DERs and power grid as critical infrastructure
 Introduces the information security principles to assess and manage the security and privacy risks of the emerging Smart Grid technologies
 Outlines the functions of the security program as well as the scope and differences between traditional IT system security requirements and those required for industrial control systems such as SCADA systems
 Offers a full array of resources—
 cybersecurity concepts, frameworks, and emerging trends
 Security Professionals and Engineers can use

Building an Effective Security Program for Distributed Energy Resources and Systems as a reliable resource that is dedicated to the essential topic of security for distributed energy resources and power grids. They will find standards, guidelines, and recommendations from standards organizations, such as ISO, IEC, NIST, IEEE, ENISA, ISA, ISACA, and ISF, conveniently included for reference within chapters.

The Industries of the Future World Scientific Advanced Technologies in Ad Hoc and Sensor Networks collects selected papers from the 7th China Conference on Wireless Sensor Networks (CWSN2013) held in Qingdao, October

17-19, 2013. The book features state-of-the-art studies on Sensor Networks in China with the theme of “Advances in wireless sensor networks of China”. The selected works can help promote development of sensor network technology towards interconnectivity, resource sharing, flexibility and high efficiency. Researchers and engineers in the field of sensor networks can benefit from the book. Xue Wang is a professor at Tsinghua University; Li Cui is a professor at Institute of Computing Technology, Chinese Academy of Sciences; Zhongwen Guo is a professor at Ocean University of China.

This book focuses on

issues related to mathematics teaching and learning resources, including mathematics textbooks, teacher guides, student learning and assessment materials, and online resources. The book highlights various theoretical and methodological approaches used to study teaching and learning resources, and addresses the areas of resources, teachers, and students at an international level. As for the resources, the book examines the role textbooks and other curricular or learning resources play in mathematics teaching, learning, and assessment. It asks questions such as: Could we consider different types of textbooks and roles they play in teaching

and learning? How does the digitalization of information and communication affect these roles? What are defining features of e-textbooks, and how could we characterize the differences between the traditional textbooks and e-textbooks? As for the teachers, the book discusses the relationships between teachers' individual and collective resources, and the way in which we could model such relationships. Specific questions addressed are: What is the role of teachers in developing textbooks and other teaching and learning materials? What are the relationships between resource designers and users? What are the consequences of these

changing roles and relationships for the teaching of mathematics, and for teacher knowledge and professional development? As for the students, the book explores how students, as well as their teachers, interact through resources. It raises and addresses questions such as: What are the effects of modern ICT (particularly internet) on students' use and the design of resources? How do changing patterns of use and design affect student behaviour, learning, and relationships to the subject of mathematics?

Leading innovation expert Alec Ross explains what's next

for the world, mapping out the advances and stumbling blocks that will emerge in the next ten years—for businesses, governments, and the global community—and how we can navigate them. While Alec Ross was working as Hillary Clinton's Senior Advisor on Innovation, he traveled to forty-one countries. He visited some of the toughest places in the world—from refugee camps of Congo to Syrian war zones. From phone-charger stands in Rwanda to R&D labs in South Korea, Ross has seen what the future holds. Over the past two decades, the Internet has radically changed markets and businesses worldwide. In *The Industries of the Future*, Ross shows us what's next,

highlighting the best opportunities for progress and explaining why countries thrive or sputter. He examines the specific fields that will most shape our economic future over the next ten years, including cybercrime and cybersecurity, the commercialization of genomics, the next step for big data, and the coming impact of digital technology on money, payments, and markets. And in each of these realms, Ross addresses the toughest questions: How will we have to adapt to the changing nature of work? Is the prospect of cyberwar sparking the next arms race? How can the world's rising nations hope to match Silicon Valley in creating their own

innovation hotspots? Ross blends storytelling and economic analysis to give a vivid and informed perspective on how sweeping global trends are affecting the ways we live, incorporating the insights of leaders ranging from the founders of Google and Twitter to defense experts like David Petraeus. *The Industries of the Future* takes the intimidating, complex topics that many of us know to be important and boils them down into clear, plain-spoken language. This is an essential work for understanding how the world works—now and tomorrow—and a must-read for businesspeople, in every sector, from every country.
